Problem

Writing code on paper is a frustrating experience. You can't catch syntax issues, test your code, or tackle large scale programming tasks. Meanwhile, as AI has grown more capable, more students offload their work to it, which inhibits their learning.

This has pushed educators to reluctantly move to pen-and-paper evaluation as the only way to gauge student knowledge. The flip side is no better: educators who've stuck with computer based evaluation have no way to prove work integrity, resulting in unfair academic dishonesty charges.

Leopard

Web IDE Platform

The Team

Solution

Leopard replaces pen-and-paper coding exams with a standardized cloud IDE where every student writes, runs, and submits code in the same controlled environment. Each submission is tied to a replayable workspace history, giving educators concrete evidence of how the work was produced and making computer-based assessment both practical and defensible.

Code Environment

We provide each student an isolated instance of VSCode

Education Platform

We let instructors create, grade, and flag assignments with management tools

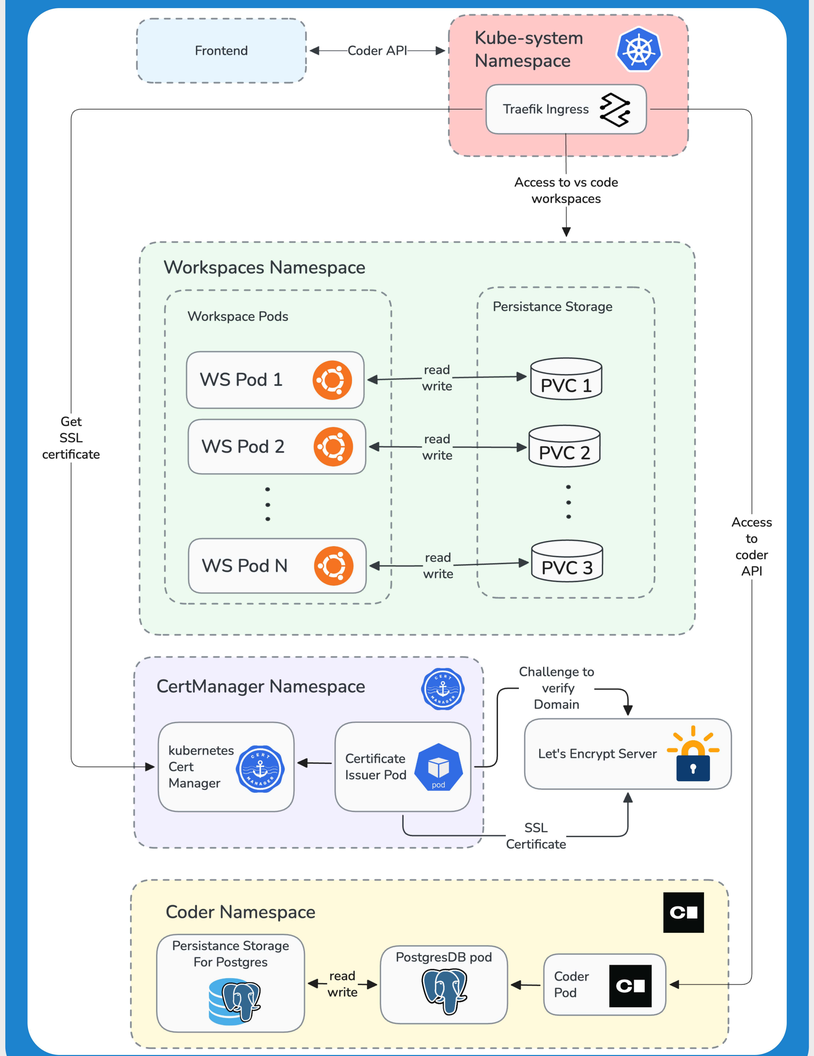
Student Replay

We log all user workspace interactions to build a complete granular replay

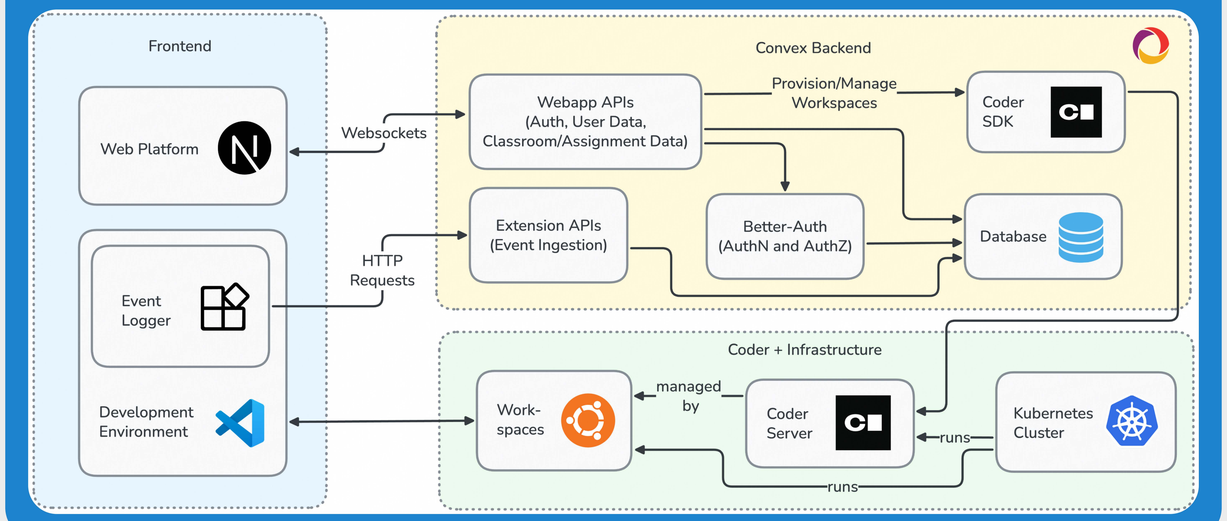
No installation

Students and teachers don't need to install any software

Infrastructure



High Level Architecture



GitHub
